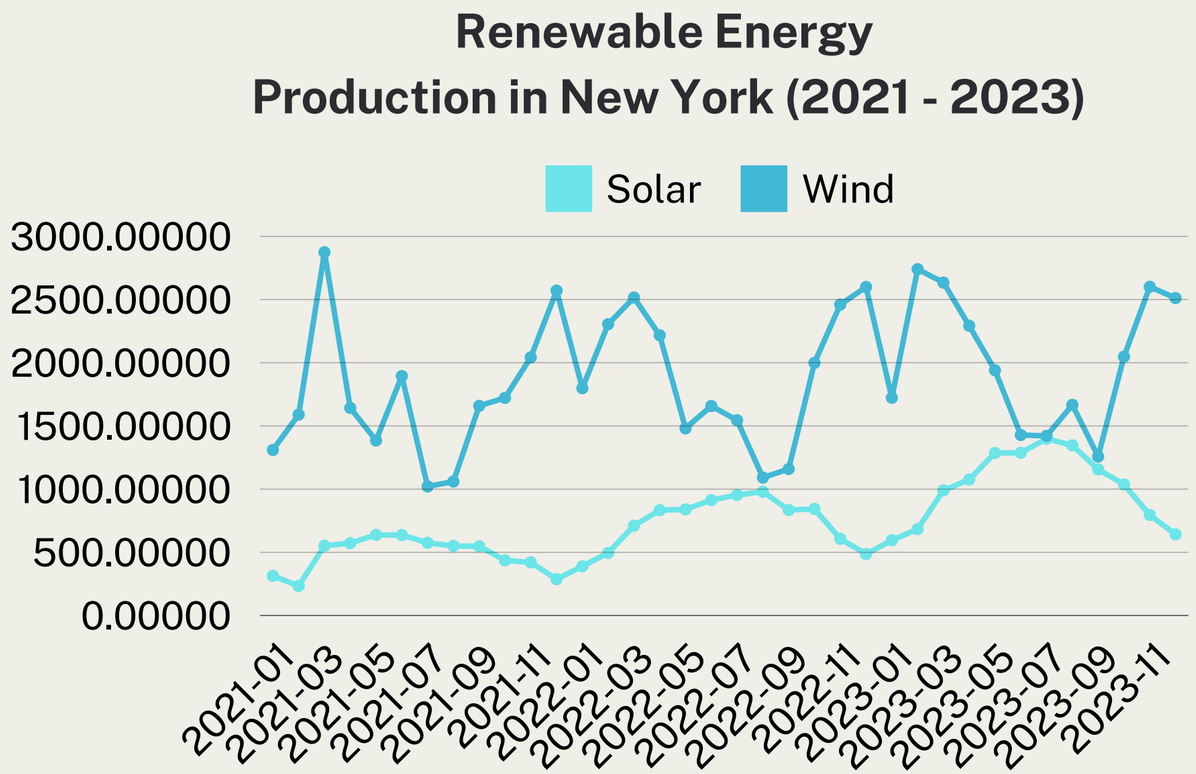
GreenSight: AI-Driven Renewable Energy Forecasting and Optimization

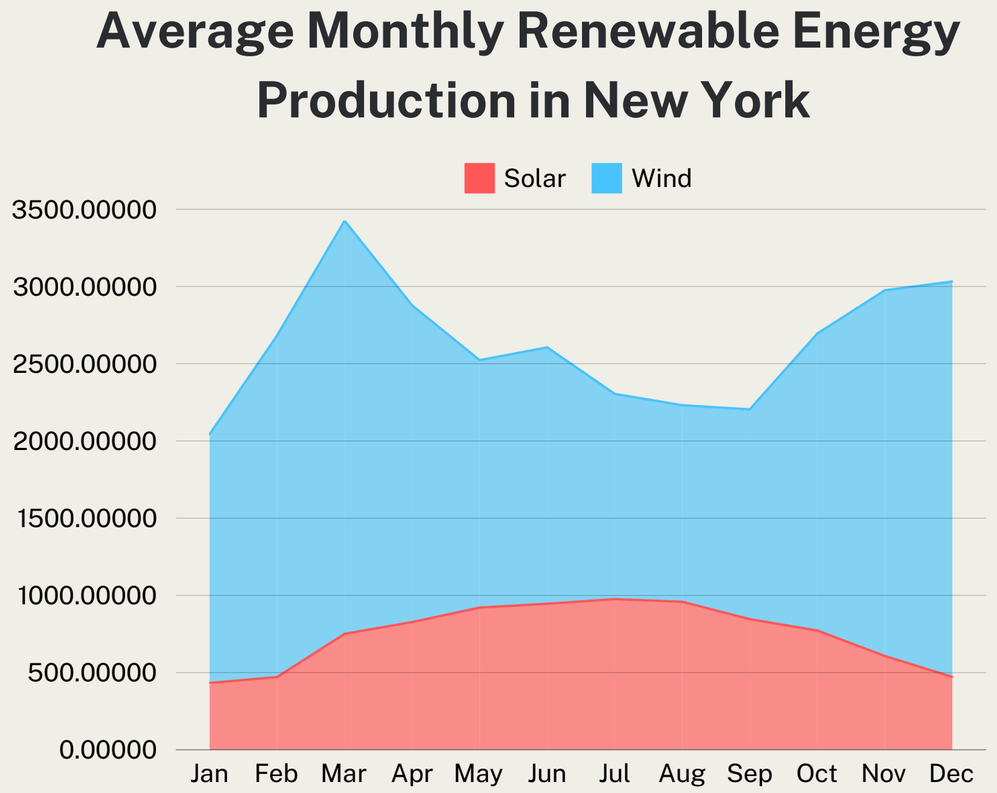
HARNESSING DATA SCIENCE FOR A SUSTAINABLE FUTURE

Joshua Pedro
Data Science, BrainStation
16 September, 2024

PROBLEM

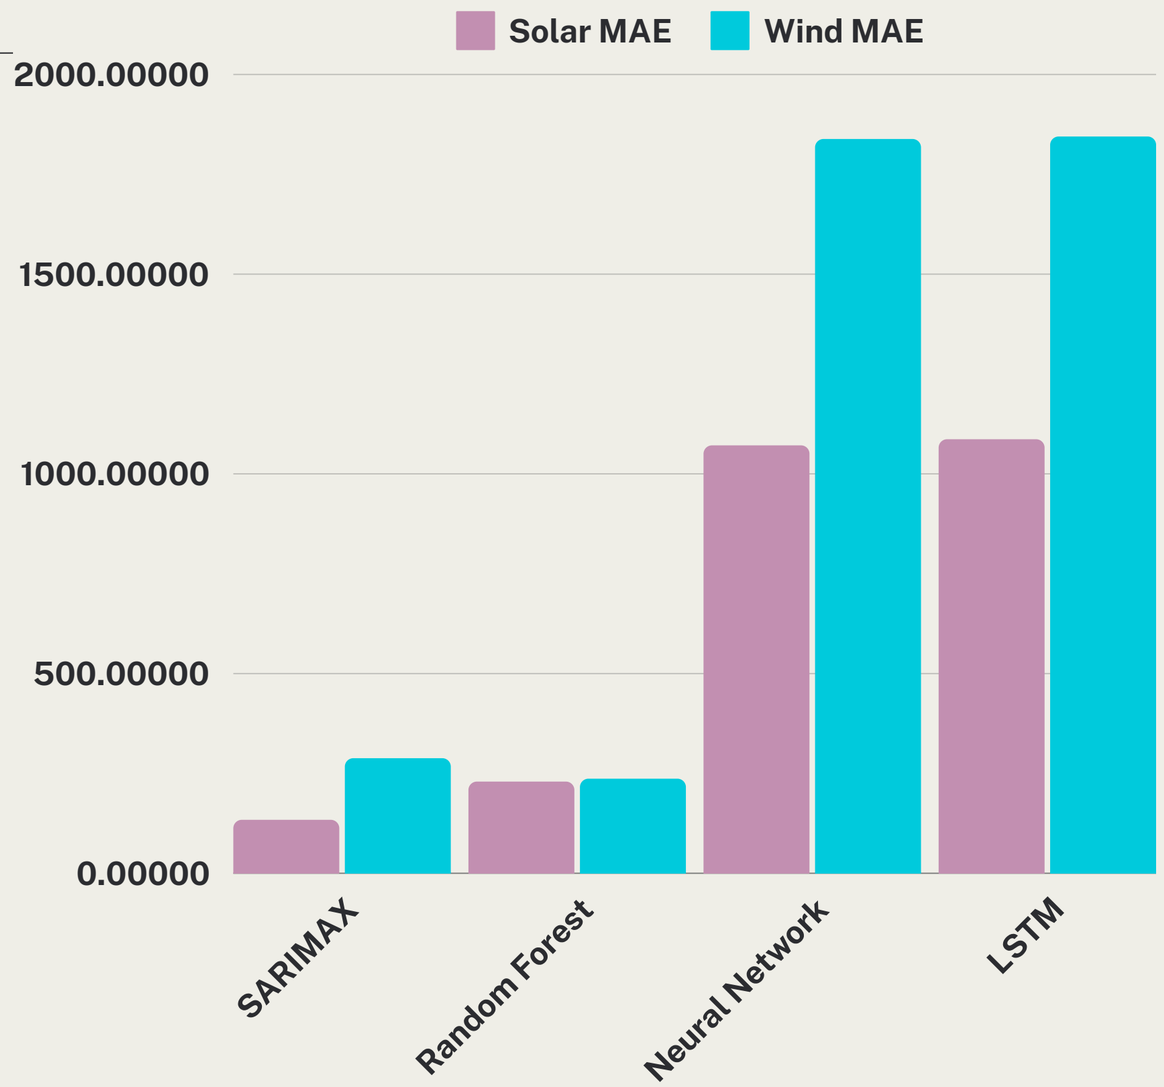
- Variability of renewable energy sources
- Need for improved grid management
- Importance of optimal site selection



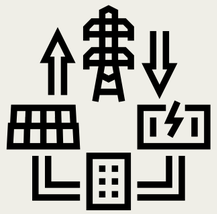


VISION AND SOLUTION

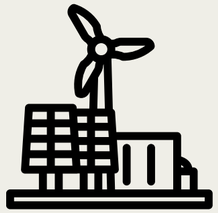
- Develop advanced forecasting models
  - SARIMAX,
  - Random Forest
  - Neural Network
  - LSTM
- Integrate geographical and weather data
- Implement AI-driven site optimization



POTENTIAL IMPACT



Improved grid stability



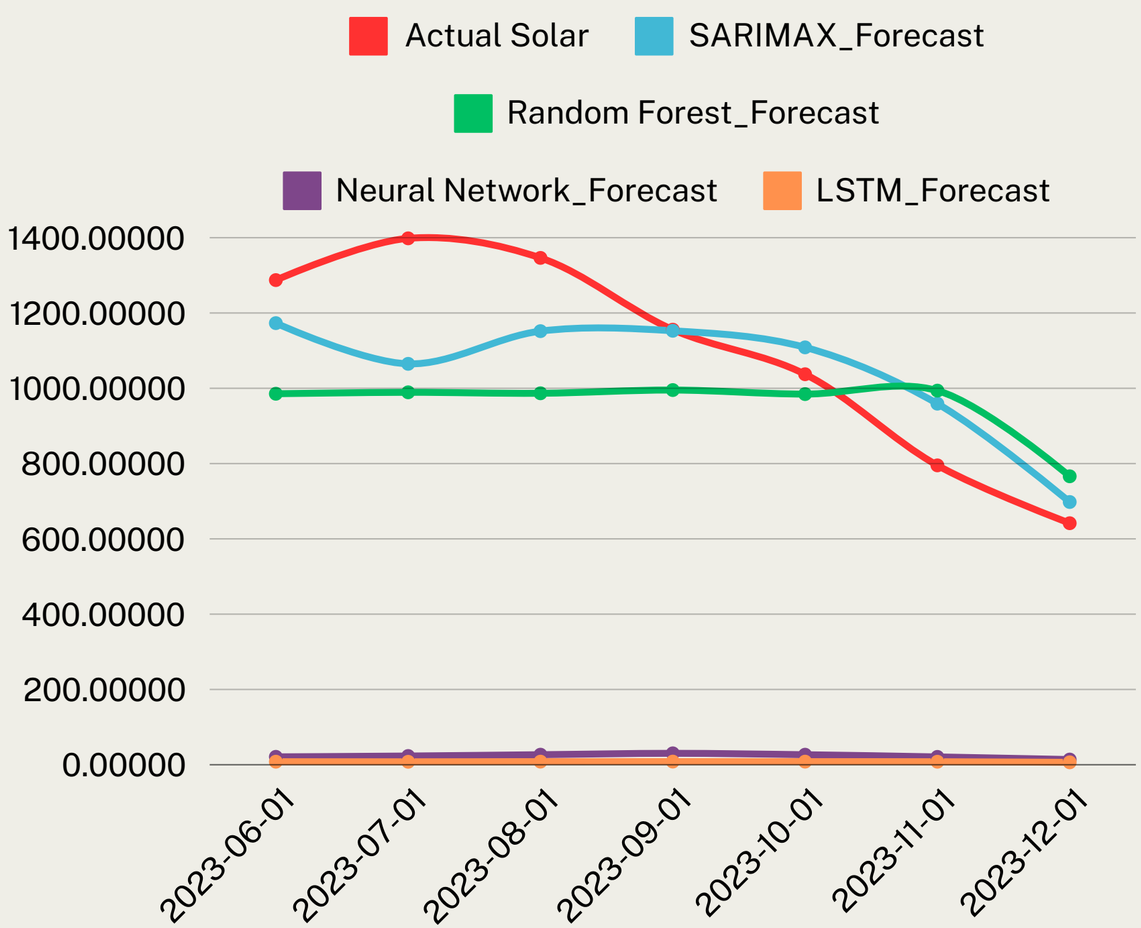
Enhanced renewable energy integration

Better decision-making tools

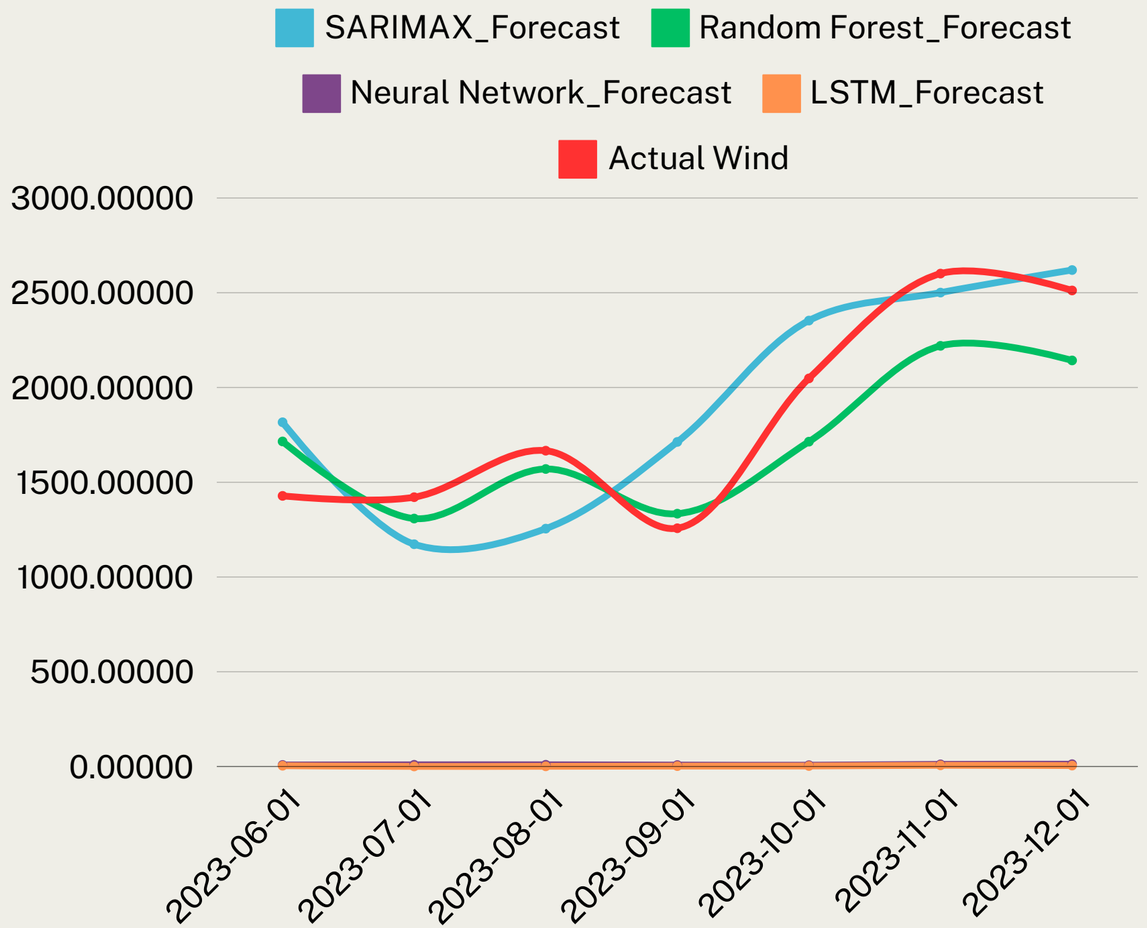
Support for policymakers

Environmental Impacts

Solar Energy Forecast



Wind Energy Forecast



OUR NUMBERS

Data *overview*

Energy production and weather data on New York State, 2021 - 2023

Data *sources*

- **Energy production:**
  - U.S. Energy Information Administration API
- **Weather data:**
  - meteostat API

Key *variables*

- **date** - date of observation
- **SUN** - solar energy production in trillion BTU
- **WND** - wind energy production in trillion BTU
- **temp** - average temperature in °C
- **wind_speed** - average wind speed in km/h
- **precipitation** - total precipitation in mm

Data *quality concerns*

- limited geographic scope
- temporal resolution
- lacking energy output of each power source

NEXT STEPS

Expand dataset

1

- Broader region
- Power plant locations
- More variables such as satellite imagery and geospatial data

Feature engineering

2

- Lag features
- seasonal indicators

Modeling

3

- Expand modeling approaches
- Tweak Neural Network
- Try ensemble methods

Implementation

4

- Implement computer vision
- Use NLP for analyzing policy documents and sentiment on building power plants.

Deploy

5

Create dashboard for a site optimization model for determining optimal locations for renewable energy based on supply and demand conditions

Thank you!
